Used data model

quotes	
PK	**id (serial integer; non-null)**
	ticker: string (max lenght: 50; non-null)
	timestamp: datetime (non-null)
	price: number (float, non-null)

Potentially better alternative data model I would use if the scope of project were to be larger / potentially need more functionality in the future:

quotes	
PK	**id (serial integer; non-null)**
FK	**ticker_id**: serial integer (non-null)
	timestamp: datetime (non-null)
	price: number (float, non-null)
FK	**currency_id**: serial integer (non-null)

tickers	
PK	**ticker_id (serial integer; non-null)**
	ticker: string (max lenght: 50; non-null)
	[some data about tickers, e.g. company name]

currencies	
PK	**currency_id (serial integer; non-null)**
	currency: string (non-null)
	[some data about currencies]
